

**Current Human Exposures Under Control**  
**Environmental Indicator (EI) RCRIS code (CA725)**

Page 2

human exposure scenarios, future land and groundwater uses, and ecological receptors).

**Duration / Applicability of EI Determinations**

EI Determinations status codes should remain in RCRIS national database ONLY as long as they remain true (i.e., RCRIS status codes must be changed when the regulatory authorities become aware of contrary information).

Are groundwater, soil, surface water, sediments, or air **media** known or reasonably suspected to be "**contaminated**"<sup>1</sup> above appropriately protective risk-based "levels" (applicable promulgated standards, as well as other appropriate standards, guidelines, guidance, or criteria) from releases subject to RCRA Corrective Action (from SWMUs, RUs or AOCs)?

	<u>Yes</u>	<u>No</u>	<u>?</u>	<u>Rationale / Key Contaminants</u>
Groundwater	X			Upper water-bearing unit is the Cockfield Formation which ranges from 8 to 78 feet in thickness at the facility. COCs in the Cockfield include: Chlorides, bromides and ethylene dibromide (EDB). Lower section of the Sparta is the predominant source of usable groundwater in Colombia County. The Albemarle facility is located in an area that does not serve as an important recharge zone for the Sparta Formation. The Cook Mountain is the confining layer above the Sparta which is about 300 feet thick at this location. Thirteen wells are located in a 3-mile radius. All wells are screened in the Sparta except for wells 18S20W22DDA1 and 18S21W03BCA1.(Ref. 1) Locations of these wells are listed in Attachment 1. Land use in the surrounding area is forestland/undeveloped.
<del>Air (indoors)</del> <sup>2</sup>				
Surface Soil (e.g., <2 ft)	X			Areas of surface soil contamination are limited to onsite locations and include: SWMU #8 Railroad Load/Unload Area, SWMU #9 Old Laboratory Waste Disposal Area, SWMUs #31, 32, and 33 Tail Brine Ponds, SWMU # 43 Sand Bed Filter, SWMU #36 South Landfill, SWMU #65 Westside Fill Area, AOC Railroad track area south of the Bromine Recovery Unit, AOC PSV#1 Drainage ditches. COCs are chlorides and bromide. (Ref. 1).
Surface Water	X			Storm water runoff may have some COCs as listed above from "contaminated" surface soils. Storm water runoff is collected and treated in the Artificial Marsh (NPDES permit AR0038857). From the NPDES outfall, surface water runs to Horsehead Creek. (See Figure 1-3 in Ref. 2).
<del>Sediment</del>				
Subsurf. Soil (e.g., >2 ft)	X			Areas of subsurface soil contamination are limited to onsite locations and include: SWMU #8 Railroad Load/Unload Area, SWMU #9 Old Laboratory Waste Disposal Area, SWMUs #31, 32, and 33 Tail Brine

<sup>1</sup> "Contamination" and "contaminated" describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately protective risk-based "levels" (for the media, that identify risks within the acceptable risk range).

<sup>2</sup> Recent evidence (from the Colorado Dept. of Public Health and Environment, and others) suggest that unacceptable indoor air concentrations are more common in structures above groundwater with volatile contaminants than previously believed. This is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration necessary to be reasonably certain that indoor air (in structures located above (and adjacent to) groundwater with volatile contaminants) does not present unacceptable risks.

DOCUMENTATION OF ENVIRONMENTAL INDICATOR DETERMINATION

Interim Final 2/5/99

**RCRA Corrective Action  
Environmental Indicator (EI) RCRIS code (CA725)**

**Current Human Exposures Under Control**

**Facility Name:** Albemarle Corporation South Plant (formerly Ethyl Corporation)  
**Facility Address:** P. O. Box 729, Magnolia, AR 71754-0729  
**Facility EPA ID #:** ARD052528809

1. Has **all** available relevant/significant information on known and reasonably suspected releases to soil, groundwater, surface water/sediments, and air, subject to RCRA Corrective Action (e.g., from Solid Waste Management Units (SWMU), Regulated Units (RU), and Areas of Concern (AOC), been **considered** in this EI determination?

  X   If yes - check here and continue with #2 below.

       If no - re-evaluate existing data, or

       if data are not available skip to #6 and enter "IN" (more information needed) status code.

**BACKGROUND**

The Albemarle Corporation South Plant Facility, located 7 miles south of Magnolia, Arkansas is completing facility-wide corrective action under a Consent Administrative Order (CAO) LIS 98-167. The former Ethyl Magnolia facility was constructed in 1969 to take advantage of the natural brine deposits of the underlying Smackover Formation. The facility has produced bromine 1,2-dibromoethane, hydrogen sulfide gas, methane, vinyl bromide, alkyl dimethylamines, calcium bromide, diethylchlorothiophosphate, decabromodiphenyloxide, tetrabromobisphenol, methyl bromide, dibromoneopentyl glycol, dibromomethane, and bromochloromethane. Chemicals of concern have been identified as chlorides, bromides and ethylene dibromide (EDB).

**Definition of Environmental Indicators (for the RCRA Corrective Action)**

Environmental Indicators (EI) are measures being used by the RCRA Corrective Action program to go beyond programmatic activity measures (e.g., reports received and approved, etc.) to track changes in the quality of the environment. The two EI developed to-date indicate the quality of the environment in relation to current human exposures to contamination and the migration of contaminated groundwater. An EI for non-human (ecological) receptors is intended to be developed in the future.

**Definition of "Current Human Exposures Under Control" EI**

A positive "Current Human Exposures Under Control" EI determination ("YE" status code) indicates that there are no "unacceptable" human exposures to "contamination" (i.e., contaminants in concentrations in excess of appropriate risk-based levels) that can be reasonably expected under current land- and groundwater-use conditions (for all "contamination" subject to RCRA corrective action at or from the identified facility (i.e., site-wide)).

**Relationship of EI to Final Remedies**

While Final remedies remain the long-term objective of the RCRA Corrective Action program the EI are near-term objectives which are currently being used as Program measures for the Government Performance and Results Act of 1993, GPRA). The "Current Human Exposures Under Control" EI are for reasonably expected human exposures under current land- and groundwater-use conditions ONLY, and do not consider potential future land- or groundwater-use conditions or ecological receptors. The RCRA Corrective Action program's overall mission to protect human health and the environment requires that Final remedies address these issues (i.e., potential future

**Current Human Exposures Under Control**  
**Environmental Indicator (EI) RCRIS code (CA725)**

Page 2

human exposure scenarios, future land and groundwater uses, and ecological receptors).

**Duration / Applicability of EI Determinations**

EI Determinations status codes should remain in RCRIS national database ONLY as long as they remain true (i.e., RCRIS status codes must be changed when the regulatory authorities become aware of contrary information).

Are groundwater, soil, surface water, sediments, or air **media** known or reasonably suspected to be "**contaminated**"<sup>1</sup> above appropriately protective risk-based "levels" (applicable promulgated standards, as well as other appropriate standards, guidelines, guidance, or criteria) from releases subject to RCRA Corrective Action (from SWMUs, RUs or AOCs)?

	<u>Yes</u>	<u>No</u>	<u>?</u>	<u>Rationale / Key Contaminants</u>
Groundwater	X			Upper water-bearing unit is the Cockfield Formation which ranges from 8 to 78 feet in thickness at the facility. COCs in the Cockfield include: Chlorides, bromides and ethylene dibromide (EDB). Lower section of the Sparta is the predominant source of usable groundwater in Colombia County. The Albemarle facility is located in an area that does not serve as an important recharge zone for the Sparta Formation. The Cook Mountain is the confining layer above the Sparta which is about 300 feet thick at this location. Thirteen wells are located in a 3-mile radius. All wells are screened in the Sparta except for wells 18S20W22DDA1 and 18S21W03BCA1.(Ref. 1) Locations of these wells are listed in Attachment 1. Land use in the surrounding area is forestland/undeveloped.
Air (indoors) <sup>2</sup>				
Surface Soil (e.g., <2 ft)	X			Areas of surface soil contamination are limited to onsite locations and include: SWMU #8 Railroad Load/Unload Area, SWMU #9 Old Laboratory Waste Disposal Area, SWMUs #31, 32, and 33 Tail Brine Ponds, SWMU # 43 Sand Bed Filter, SWMU #36 South Landfill, SWMU #65 Westside Fill Area, AOC Railroad track area south of the Bromine Recovery Unit, AOC PSV#1 Drainage ditches. COCs are chlorides and bromide. (Ref. 1).
Surface Water	X			Storm water runoff may have some COCs as listed above from "contaminated" surface soils. Storm water runoff is collected and treated in the Artificial Marsh (NPDES permit AR0038857). From the NPDES outfall, surface water runs to Horsehead Creek. (See Figure 1-3 in Ref. 2).
Sediment				
Subsurf. Soil (e.g., >2 ft)	X			Areas of subsurface soil contamination are limited to onsite locations and include: SWMU #8 Railroad Load/Unload Area, SWMU #9 Old Laboratory Waste Disposal Area, SWMUs #31, 32, and 33 Tail Brine

<sup>1</sup> "Contamination" and "contaminated" describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately protective risk-based "levels" (for the media, that identify risks within the acceptable risk range).

<sup>2</sup> Recent evidence (from the Colorado Dept. of Public Health and Environment, and others) suggest that unacceptable indoor air concentrations are more common in structures above groundwater with volatile contaminants than previously believed. This is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration necessary to be reasonably certain that indoor air (in structures located above (and adjacent to) groundwater with volatile contaminants) does not present unacceptable risks.

2 - "Description of Current Conditions Report, South Plant Facility". May 2001. IT Corporation.

3. Are there **complete pathways** between "contamination" and human receptors such that exposures can be reasonably expected under the current (land- and groundwater-use) conditions?

Summary Exposure Pathway Evaluation Table

Potential **Human Receptors** (Under Current Conditions)

<b>"Contaminated" Media</b>	<b>Residents</b>	<b>Workers</b>	<b>Day-Care</b>	<b>Construction</b>	<b>Trespassers</b>	<b>Recreation</b>	<b>Food<sup>3</sup></b>
Groundwater	N	N	N	N	N	N	N
Air (indoors)							
Soil (surface, e.g., <2 ft)	N	Y	N	Y	N	N	N
Surface Water	N	N	N	N	N	N	N
Sediment							
Soil (subsurface e.g., >2 ft)	N	N	N	Y	N	N	N
Air (outdoors)							

Instructions for Summary Exposure Pathway Evaluation Table:

1. Strike-out specific Media including Human Receptors' spaces for Media which are not "contaminated" as identified in #2 above.
2. enter "yes" or "no" for potential "completeness" under each "Contaminated" Media -- Human Receptor combination (Pathway).

<sup>3</sup> Indirect Pathway/Receptor (e.g., vegetables, fruits, crops, meat and dairy products, fish, shellfish, etc.)

**Current Human Exposures Under Control**  
**Environmental Indicator (EI) RCRIS code (CA725)**  
Page 4

Note: In order to focus the evaluation to the most probable combinations some potential "Contaminated" Media - Human Receptor combinations (Pathways) do not have check spaces ("\_\_\_"). While these combinations may not be probable in most situations they may be possible in some settings and should be added as necessary.

- \_\_\_\_\_ If no (pathways are not complete for any contaminated media-receptor combination) - skip to #6, and enter "YE" status code, after explaining and/or referencing condition(s) in-place, whether natural or man-made, preventing a complete exposure pathway from each contaminated medium (e.g., use optional Pathway Evaluation Work Sheet to analyze major pathways).
- ☒ If yes (pathways are complete for any "Contaminated" Media - Human Receptor combination) - continue after providing supporting explanation.
- \_\_\_\_\_ If unknown (for any "Contaminated" Media - Human Receptor combination) - skip to #6 and enter "IN" status code.

**Rationale and Reference(s):**

Groundwater: Exposure pathways for residents, daycare facilities, recreation or food pathways are incomplete because there is no evidence that contaminated groundwater from the shallow uppermost water-bearing unit (the Cockfield) has migrated offsite. Also, offsite migration is not expected because the facility has installed a Leachate Interception System (LIS) which collects contaminated groundwater from the Cockfield Formation. Figure 3-5 in the DOCC(Ref. 2) is a potentiometric map which shows that groundwater in the Cockfield flows in a general eastward direction. The LIS was installed in 90's and updated in '95, and consists of a french drain/slurry wall system and sumps located along the easternmost boundary of the facility. The slurry wall is keyed into the Cook Mountain Formation clay layer in order to capture groundwater in saturated zones of the Cockfield. In 1999 the groundwater monitoring system was expanded with the installation of 2 additional wells to insure additional coverage. Exposure pathways for workers and construction workers onsite is considered to be incomplete because the depth to groundwater at the facility averages from 25 to 30 feet below ground surface. (Ref. 1)

Surface soils: Exposure pathways for contaminated surface soil are considered complete for the onsite worker and construction workers. The trespasser scenario is considered incomplete because the site is fenced and maintains 24-hour controls. Exposure pathways for residents, daycare facilities, recreation and food are considered incomplete because there is no offsite contaminated surface soils, according to the documents reviewed. Also, the surrounding land use is undeveloped and forestland.

Subsurface soils: Exposure pathways for contaminated subsurface soil is considered complete for the onsite construction worker. All other exposure scenarios are considered incomplete because contaminated subsurface soils are only onsite.

Surface water: Exposure pathways for surface water exposure which may contain elevated levels of COCs are not considered complete because the surface water runoff at the facility is controlled through the use of a storm water drainage system. All surface water is collected and treated in the Artificial Marsh and is discharged through a NPDES outfall (NPDES permit AR0038857).

**Current Human Exposures Under Control**  
**Environmental Indicator (EI) RCRIS code (CA725)**  
Page 5

4. Can the **exposures** from any of the complete pathways identified in #3 be reasonably expected to be "**significant**"<sup>4</sup> (i.e., potentially "unacceptable" because exposures can be reasonably expected to be: 1) greater in magnitude (intensity, frequency and/or duration) than assumed in the derivation of the acceptable "levels" (used to identify the "contamination"); or 2) the combination of exposure magnitude (perhaps even though low) and contaminant concentrations (which may be substantially above the acceptable "levels") could result in greater than acceptable risks)?

  X   If no (exposures can not be reasonably expected to be significant (i.e., potentially "unacceptable") for any complete exposure pathway) - skip to #6 and enter "YE" status code after explaining and/or referencing documentation justifying why the exposures (from each of the complete pathways) to "contamination" (identified in #3) are not expected to be "significant."

       If yes (exposures could be reasonably expected to be "significant" (i.e., potentially "unacceptable") for any complete exposure pathway) - continue after providing a description (of each potentially "unacceptable" exposure pathway) and explaining and/or referencing documentation justifying why the exposures (from each of the remaining complete pathways) to "contamination" (identified in #3) are not expected to be "significant."

       If unknown (for any complete pathway) - skip to #6 and enter "IN" status code

**Rationale and Reference(s):**

Exposure pathways considered complete were: 1) onsite worker to contaminated surface soils, 2) onsite construction worker to contaminated surface and subsurface soils. Exposures for the complete pathways described are considered to be **insignificant** because of the following rationale:

- 1) For the onsite worker, Albemarle South facility has a controlled environment where workers are required to complete worker safety training which informs them of contaminants of concern and how to prevent exposures through the use of proper protocol for entry into a "contaminated area" and the use of proper protective equipment.
- 2) For the construction worker, Albemarle South facility has specific contractor requirements for using proper protocol (such as obtaining worker permits before any excavation activity) along with the use of required employee training.

---

<sup>4</sup> If there is any question on whether the identified exposures are "significant" (i.e., potentially "unacceptable") consult a human health Risk Assessment specialist with appropriate education, training and experience.

**Current Human Exposures Under Control**  
**Environmental Indicator (EI) RCRIS code (CA725)**  
Page 6

5. Can the "significant" exposures (identified in #4) be shown to be within **acceptable** limits?

- \_\_\_\_\_ If yes (all "significant" exposures have been shown to be within acceptable limits) - continue and enter "YE" after summarizing and referencing documentation justifying why all "significant" exposures to "contamination" are within acceptable limits (e.g., a site-specific Human Health Risk Assessment).
- \_\_\_\_\_ If no (there are current exposures that can be reasonably expected to be "unacceptable")- continue and enter "NO" status code after providing a description of each potentially "unacceptable" exposure.
- \_\_\_\_\_ If unknown (for any potentially "unacceptable" exposure) - continue and enter "IN" status code.

Rationale and Reference(s):

**Current Human Exposures Under Control**  
**Environmental Indicator (EI) RCRIS code (CA725)**  
 Page 7

6. Check the appropriate RCRIS status codes for the Current Human Exposures Under Control EI event code (CA725), and obtain Supervisor (or appropriate Manager) signature and date on the EI determination below (and attach appropriate supporting documentation as well as a map of the facility):

  X   YE - Yes, "Current Human Exposures Under Control" has been verified. Based on a review of the information contained in this EI Determination, "Current Human Exposures" are expected to be "Under Control" at the Albemarle South facility, EPA ID ARD052528809, located at Magnolia, Arkansas under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.

       NO - "Current Human Exposures" are NOT "Under Control."

       IN - More information is needed to make a determination.

DOCUMENTATION OF ENVIRONMENTAL INDICATOR DETERMINATION

Interim Final 2/5/99

**RCRA Corrective Action  
Environmental Indicator (EI) RCRIS code (CA750)**

**Migration of Contaminated Groundwater Under Control**

**Facility Name:** Albemarle Corporation South Plant (formerly Ethyl Corporation)  
**Facility Address:** P. O. Box 729, Magnolia, AR 71754-0729  
**Facility EPA ID #:** ARD052528809

1. Has **all** available relevant/significant information on known and reasonably suspected releases to the groundwater media, subject to RCRA Corrective Action (e.g., from Solid Waste Management Units (SWMU), Regulated Units (RU), and Areas of Concern (AOC)), been **considered** in this EI determination?

☒ **X** If yes - check here and continue with #2 below.

☐ If no - re-evaluate existing data, or

☐ if data are not available skip to #6 and enter "IN" (more information needed) status code.

**BACKGROUND**

**Definition of Environmental Indicators (for the RCRA Corrective Action)**

Environmental Indicators (EI) are measures being used by the RCRA Corrective Action program to go beyond programmatic activity measures (e.g., reports received and approved, etc.) to track changes in the quality of the environment. The two EI developed to-date indicate the quality of the environment in relation to current human exposures to contamination and the migration of contaminated groundwater. An EI for non-human (ecological) receptors is intended to be developed in the future.

**Definition of "Migration of Contaminated Groundwater Under Control" EI**

A positive "Migration of Contaminated Groundwater Under Control" EI determination ("YE" status code) indicates that the migration of "contaminated" groundwater has stabilized, and that monitoring will be conducted to confirm that contaminated groundwater remains within the original "area of contaminated groundwater" (for all groundwater "contamination" subject to RCRA corrective action at or from the identified facility (i.e., site-wide)).

**Relationship of EI to Final Remedies**

While Final remedies remain the long-term objective of the RCRA Corrective Action program the EI are near-term objectives which are currently being used as Program measures for the Government Performance and Results Act of 1993, GPRA). The "Migration of Contaminated Groundwater Under Control" EI pertains **ONLY** to the physical migration (i.e., further spread) of contaminated ground water and contaminants within groundwater (e.g., non-aqueous phase liquids or NAPLs). Achieving this EI does not substitute for achieving other stabilization or final remedy requirements and expectations associated with sources of contamination and the need to restore, wherever practicable, contaminated groundwater to be suitable for its designated current and future uses.

**Duration / Applicability of EI Determinations**

EI Determinations status codes should remain in RCRIS national database **ONLY** as long as they remain true (i.e., RCRIS status codes must be changed when the regulatory authorities become aware of contrary information).

**Migration of Contaminated Groundwater Under Control**  
**Environmental Indicator (EI) RCRIS code (CA750)**

Page 2

2. Is **groundwater** known or reasonably suspected to be "**contaminated**"<sup>1</sup> above appropriately protective "levels" (i.e., applicable promulgated standards, as well as other appropriate standards, guidelines, guidance, or criteria) from releases subject to RCRA Corrective Action, anywhere at, or from, the facility?

- ☒ If yes - continue after identifying key contaminants, citing appropriate "levels," and referencing supporting documentation.
- ☐ If no - skip to #8 and enter "YE" status code; after citing appropriate "levels," and referencing supporting documentation to demonstrate that groundwater is not "contaminated."
- ☐ If unknown - skip to #8 and enter "IN" status code.

**Rationale and Reference(s):**

The upper water-bearing zone at the Albemarle South facility has elevated levels of the following constituents at these approximate concentrations, as measured from a recent sampling event; (Ref. 1 and Ref. 2 at end of document)

**COC**

total chlorides	69,000 mg/l
bromide	640 mg/l
EDB	4.4 mg/l

Upper water-bearing unit is the Cockfield Formation which ranges from 8 to 78 feet in thickness at the facility. COCs in the Cockfield include: Chlorides, bromides and ethylene dibromide (EDB). Lower section of the Sparta is the predominant source of usable groundwater in Colombia County. The Albemarle facility is located in an area that does not serve as an important recharge zone for the Sparta Formation. The Cook Mountain is the confining layer above the Sparta which is about 300 feet thick at this location (Ref.1).

---

<sup>1</sup> "Contamination" and "contaminated" describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriate "levels" (appropriate for the protection of the groundwater resource and its beneficial uses).

**Migration of Contaminated Groundwater Under Control**  
**Environmental Indicator (EI) RCRIS code (CA750)**  
Page 3

3. Has the **migration** of contaminated groundwater **stabilized** (such that contaminated groundwater is expected to remain within "existing area of contaminated groundwater"<sup>2</sup> as defined by the monitoring locations designated at the time of this determination)?

  X   If yes - continue, after presenting or referencing the physical evidence (e.g., groundwater sampling/measurement/migration barrier data) and rationale why contaminated groundwater is expected to remain within the (horizontal or vertical) dimensions of the "existing area of groundwater contamination"<sup>2</sup>).

       If no (contaminated groundwater is observed or expected to migrate beyond the designated locations defining the "existing area of groundwater contamination"<sup>2</sup>) - skip to #8 and enter "NO" status code, after providing an explanation.

       If unknown - skip to #8 and enter "IN" status code.

**Rationale and Reference(s):**

Offsite migration of groundwater from the Cockfield is not expected because the facility has installed a Leachate Interception System (LIS) which collects contaminated groundwater from the Cockfield Formation. Figure 3-5 in the DOCC (Ref. 2) is a potentiometric map which shows that groundwater in the Cockfield flows in a general eastward direction. The LIS was installed in 90's and updated in '95, and consists of a french drain/slurry wall system and sumps located along the easternmost boundary of the facility. The slurry wall is keyed into the Cook Mountain Formation clay layer in order to capture groundwater in saturated zones of the Cockfield. In 1999 the groundwater monitoring system was expanded with the installation of 2 additional wells to insure additional coverage.

---

<sup>2</sup> "existing area of contaminated groundwater" is an area (with horizontal and vertical dimensions) that has been verifiably demonstrated to contain all relevant groundwater contamination for this determination, and is defined by designated (monitoring) locations proximate to the outer perimeter of "contamination" that can and will be sampled/tested in the future to physically verify that all "contaminated" groundwater remains within this area, and that the further migration of "contaminated" groundwater is not occurring. Reasonable allowances in the proximity of the monitoring locations are permissible to incorporate formal remedy decisions (i.e., including public participation) allowing a limited area for natural attenuation.

**Migration of Contaminated Groundwater Under Control**  
**Environmental Indicator (EI) RCRIS code (CA750)**

Page 4

4. Does "contaminated" groundwater **discharge** into **surface water** bodies?

\_\_\_\_\_ If yes - continue after identifying potentially affected surface water bodies.

**X** If no - skip to #7 (and enter a "YE" status code in #8, if #7 = yes) after providing an explanation and/or referencing documentation supporting that groundwater "contamination" does not enter surface water bodies.

\_\_\_\_\_ If unknown - skip to #8 and enter "IN" status code.

**Rationale and Reference(s):**

Offsite migration of groundwater from the Cockfield is not expected because the facility has installed a Leachate Interception System (LIS) which collects contaminated groundwater from the Cockfield Formation. Figure 3-5 in the DOCC (Ref. 2) is a potentiometric map which shows that groundwater in the Cockfield flows in a general eastward direction. The LIS was installed in 90's and updated in '95, and consists of a french drain/slurry wall system and sumps located along the easternmost boundary of the facility. The slurry wall is keyed into the Cook Mountain Formation clay layer in order to capture groundwater in saturated zones of the Cockfield. In 1999 the groundwater monitoring system was expanded with the installation of 2 additional wells to insure additional coverage.

**Environmental Indicator (EI) RCRIS code (CA750)**  
Page 5

5. Is the **discharge** of "contaminated" groundwater into surface water likely to be "**insignificant**" (i.e., the maximum concentration<sup>3</sup> of each contaminant discharging into surface water is less than 10 times their appropriate groundwater "level," and there are no other conditions (e.g., the nature, and number, of discharging contaminants, or environmental setting), which significantly increase the potential for unacceptable impacts to surface water, sediments, or eco-systems at these concentrations)?

\_\_\_\_\_ If yes - skip to #7 (and enter "YE" status code in #8 if #7 = yes), after documenting: 1) the maximum known or reasonably suspected concentration<sup>3</sup> of key contaminants discharged above their groundwater "level," the value of the appropriate "level(s)," and if there is evidence that the concentrations are increasing; and 2) provide a statement of professional judgement/explanation (or reference documentation) supporting that the discharge of groundwater contaminants into the surface water is not anticipated to have unacceptable impacts to the receiving surface water, sediments, or eco-system.

\_\_\_\_\_ If no - (the discharge of "contaminated" groundwater into surface water is potentially significant) - continue after documenting: 1) the maximum known or reasonably suspected concentration<sup>3</sup> of each contaminant discharged above its groundwater "level," the value of the appropriate "level(s)," and if there is evidence that the concentrations are increasing; and 2) for any contaminants discharging into surface water in concentrations<sup>3</sup> greater than 100 times their appropriate groundwater "levels," the estimated total amount (mass in kg/yr) of each of these contaminants that are being discharged (loaded) into the surface water body (at the time of the determination), and identify if there is evidence that the amount of discharging contaminants is increasing.

\_\_\_\_\_ If unknown - enter "IN" status code in #8.

Rationale and Reference(s):

---

<sup>3</sup> As measured in groundwater prior to entry to the groundwater-surface water/sediment interaction (e.g., hyporheic) zone.

Environmental Indicator (EI) RCRIS code (CA750)**

Page 6

6. Can the **discharge** of "contaminated" groundwater into surface water be shown to be "**currently acceptable**" (i.e., not cause impacts to surface water, sediments or eco-systems that should not be allowed to continue until a final remedy decision can be made and implemented<sup>4</sup>)?

\_\_\_\_\_ If yes - continue after either: 1) identifying the Final Remedy decision incorporating these conditions, or other site-specific criteria (developed for the protection of the site's surface water, sediments, and eco-systems), and referencing supporting documentation demonstrating that these criteria are not exceeded by the discharging groundwater; OR 2) providing or referencing an interim-assessment,<sup>5</sup> appropriate to the potential for impact, that shows the discharge of groundwater contaminants into the surface water is (in the opinion of a trained specialists, including ecologist) adequately protective of receiving surface water, sediments, and eco-systems, until such time when a full assessment and final remedy decision can be made. Factors which should be considered in the interim-assessment (where appropriate to help identify the impact associated with discharging groundwater) include: surface water body size, flow, use/classification/habitats and contaminant loading limits, other sources of surface water/sediment contamination, surface water and sediment sample results and comparisons to available and appropriate surface water and sediment "levels," as well as any other factors, such as effects on ecological receptors (e.g., via bio-assays/benthic surveys or site-specific ecological Risk Assessments), that the overseeing regulatory agency would deem appropriate for making the EI determination.

\_\_\_\_\_ If no - (the discharge of "contaminated" groundwater can not be shown to be "**currently acceptable**") - skip to #8 and enter "NO" status code, after documenting the currently unacceptable impacts to the surface water body, sediments, and/or eco-systems.

\_\_\_\_\_ If unknown - skip to 8 and enter "IN" status code.

Rationale and Reference(s):

---

<sup>4</sup> Note, because areas of inflowing groundwater can be critical habitats (e.g., nurseries or thermal refugia) for many species, appropriate specialist (e.g., ecologist) should be included in management decisions that could eliminate these areas by significantly altering or reversing groundwater flow pathways near surface water bodies.

<sup>5</sup> The understanding of the impacts of contaminated groundwater discharges into surface water bodies is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration to be reasonably certain that discharges are not causing currently unacceptable impacts to the surface waters, sediments or eco-systems.

7. Will groundwater **monitoring** / measurement data (and surface water/sediment/ecological data, as necessary) be collected in the future to verify that contaminated groundwater has remained within the horizontal (or vertical, as necessary) dimensions of the "existing area of contaminated groundwater?"

  X   If yes - continue after providing or citing documentation for planned activities or future sampling/measurement events. Specifically identify the well/measurement locations which will be tested in the future to verify the expectation (identified in #3) that groundwater contamination will not be migrating horizontally (or vertically, as necessary) beyond the "existing area of groundwater contamination."

\_\_\_\_\_ If no - enter "NO" status code in #8.

\_\_\_\_\_ If unknown - enter "IN" status code in #8.

Rationale and Reference(s):

Groundwater monitoring is routinely carried out at the Albemarle South facility as part of their Consent Administrative Order (CAO) LIS 98-167.

8. Check the appropriate RCRIS status codes for the Migration of Contaminated Groundwater Under Control EI (event code CA750), and obtain Supervisor (or appropriate Manager) signature and date on the EI determination below (attach appropriate supporting documentation as well as a map of the facility).

  X   YE - Yes, "Migration of Contaminated Groundwater Under Control" has been verified. Based on a review of the information contained in this EI determination, it has been determined that the "Migration of Contaminated Groundwater" is "Under Control" at the Albemarle South facility, EPA ID ARD052528809, located at Magnolia, Arkansas. Specifically, this determination indicates that the migration of "contaminated" groundwater is under control, and that monitoring will be conducted to confirm that contaminated groundwater remains within the "existing area of contaminated groundwater" This determination will be re-evaluated when the Agency becomes aware of significant changes at the facility.

       NO - Unacceptable migration of contaminated groundwater is observed or expected.

       IN - More information is needed to make a determination.
